

eMoksha
A DATA SCIENCE COMPANY

“

eMoksha Demand Planning has completely transformed how we order steel. A tedious and frustrating process that used to take days with pouring over Excel files, purchase orders, and not to mention the 'gut' feel of warehouse staff is now a point-and-click, 30-minute exercise with pinpoint accuracy. We are saving so much money, time, and effort with Demand Planning.

- Melissa Supler,
Chief Operating Officer, Lyman Steel

Inventory Optimizing and Forecast Accuracy Improvement

eMoksha Demand Planning service is a cloud-based service that uses AI algorithms, historical data, and machine learning to help a steel distribution business predict future inventory needs. It predicts what, when and how much to order from a supplier. This helps optimize item levels in the warehouse and enhances supply chain planning and timely customer order fulfilment.

How does this demand planning service work?

Key Features and Benefits:

Profitability and ROI: Ensure that your warehouse is stocked with the necessary items to fill customer orders without excess items that sit in the warehouse thus freeing up cash

Time and Effort Savings: Stop hunting for data at decision time. Speed is everything in today's business. Save significant staff time and effort to figure out what's needed, when needed, and how much is needed with the click of a button

Superior Customer Service: Accurately predict when an item will arrive in the warehouse and set customer expectations for the delivery accordingly; help build predictability of item availability for your customers

Challenges our demand planning service solves:

Short-Time Window: Steel business is unique in its own way. Mills and suppliers give a very short time window to order. If you don't have an accurate demand forecast at your fingertips then you resort to manual processes, gut feeling, and guesswork to push the order through knowing well that your business can do better than that.

Lost Sales: How do you ensure you have the right product stocked for the right customer need? Ensure product availability and maximize sales by accurately planning for future demand.

Excess Inventory: Cost-Eliminate excess overhead associated with storing unsold inventory.
